Lab 1: Understanding of a Hub Network

2 February 2023

Address Table

Host (device name)	IP Address (unique)	Mask (same for all)
PC0	192.168.1.100	255.255.255.0
PC1	192.168.1.101	255.255.255.0
PC2	192.168.1.102	255.255.255.0
PC3	192.168.1.103	255.255.255.0
PC4	192.168.1.104	255.255.255.0
PC5	192.168.1.105	255.255.255.0

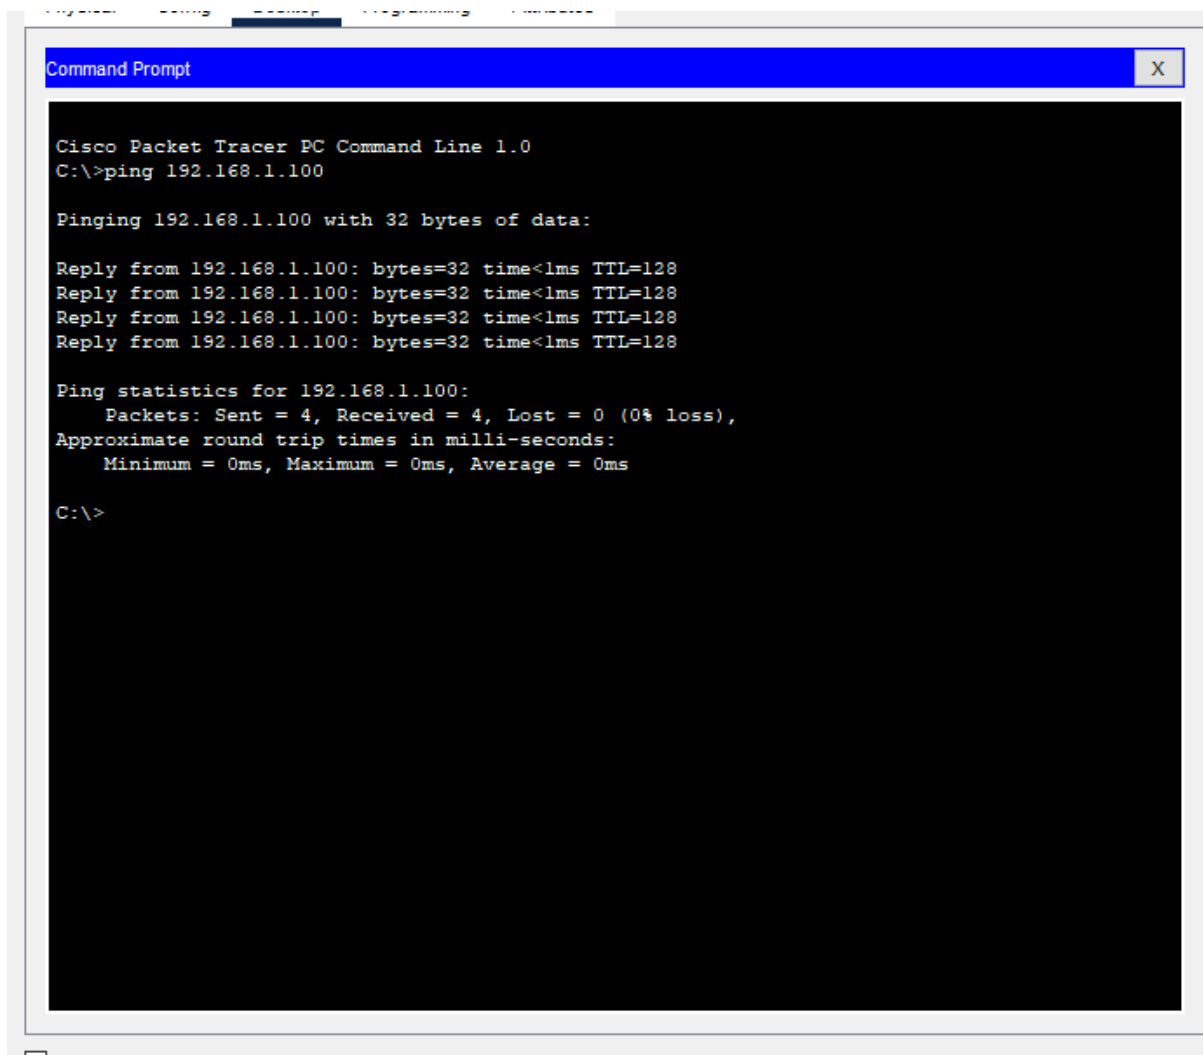

Picture of the network

Every PC is connected to the hub which connects the PCs together. This way the devices can communicate with each other within this network. The hub only allows communication inside the network. If you want to connect to outside networks, you need a router for this.

If PC0 wants to communicate with PC5 it will send a signal to the hub and the hub will resend this signal to all other PCs within this network. The hub is unable to store MAC addresses so it's unable to differentiate between the devices on the network. Every message will be shared among each computer on the network.

PC0 connected to the network. Same ping command executed for every PC.

```
Command Prompt
Cisco Packet Tracer PC Command Line 1.0
C:\>ping 192.168.1.100

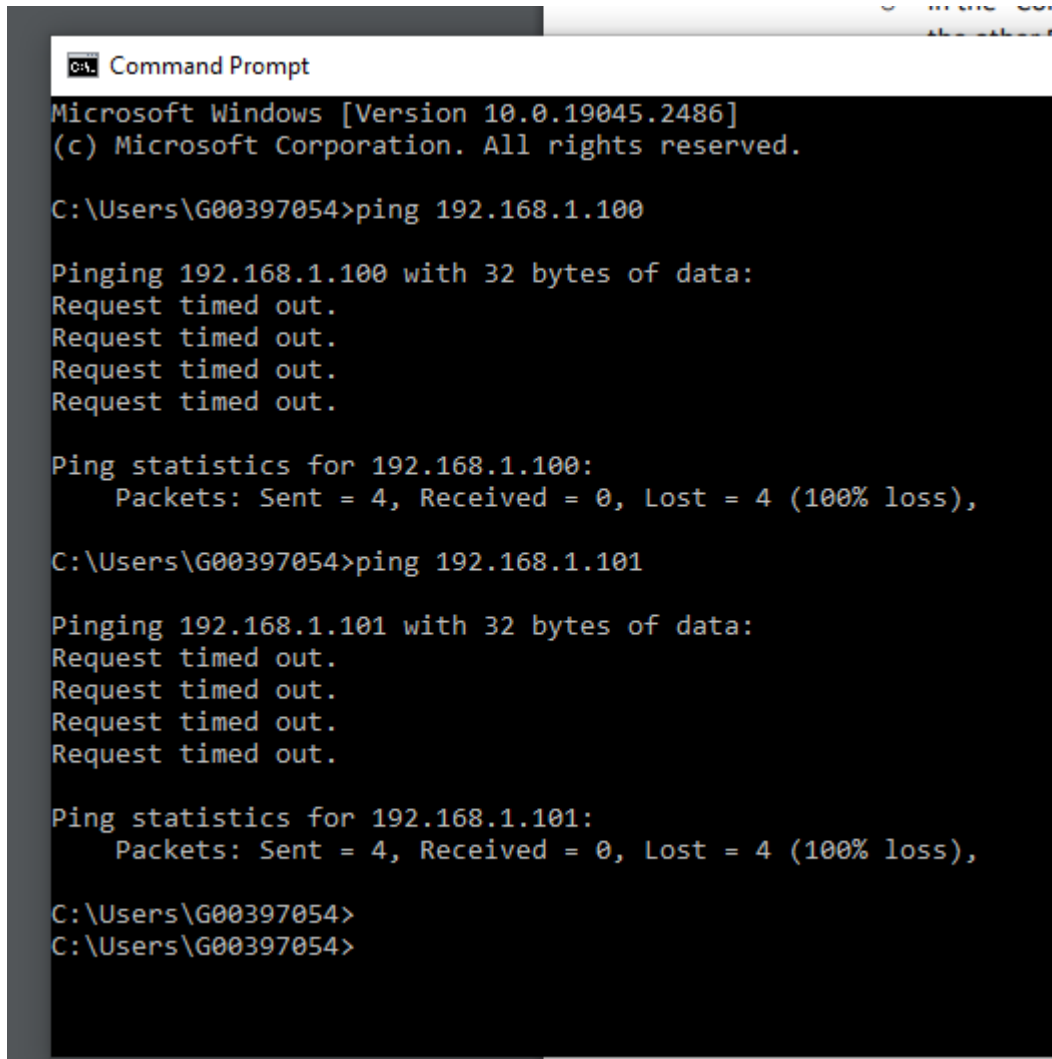

Pinging 192.168.1.100 with 32 bytes of data:

Reply from 192.168.1.100: bytes=32 time<1ms TTL=128
Reply from 192.168.1.100: bytes=32 time<1ms TTL=128
Reply from 192.168.1.100: bytes=32 time<1ms TTL=128
Reply from 192.168.1.100: bytes=32 time<1ms TTL=128

Ping statistics for 192.168.1.100:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0ms

C:\>
```

PC0 is not connected to the hub.

A screenshot of a Windows Command Prompt window. The title bar says "Command Prompt". The text inside shows the user running two ping commands. The first command is "ping 192.168.1.100", which results in four "Request timed out." messages and a summary showing "Packets: Sent = 4, Received = 0, Lost = 4 (100% loss)". The second command is "ping 192.168.1.101", which also results in four "Request timed out." messages and a similar summary. The prompt is "C:\Users\G00397054>" for both commands.

C:\Users\G00397054>ping 192.168.1.100

Pinging 192.168.1.100 with 32 bytes of data:
Request timed out.
Request timed out.
Request timed out.
Request timed out.

Ping statistics for 192.168.1.100:
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),

C:\Users\G00397054>ping 192.168.1.101

Pinging 192.168.1.101 with 32 bytes of data:
Request timed out.
Request timed out.
Request timed out.
Request timed out.

Ping statistics for 192.168.1.101:
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),

C:\Users\G00397054>
C:\Users\G00397054>
```

If one PC goes down, it does not affect the network functionality. It just means that you cannot communicate with that PC.

If a connection is broken, it means that you can't connect to the hub, and you can't communicate with the other PCs.

If the hub breaks down, the entire network will fail. The computers are not connected and there's no communication. If a router is connected to the hub, then the PCs will also lose access to external networks.
